

NO HEAT:

- If your thermostat is digital, please change the batteries and verify it is calling for heat.
- Check to make sure your furnace filter is clean; if it has not been changed recently please ensure that it is not clogged with debris.
- There is a switch near the furnace it looks like a normal light switch to turn it on/off. Please verify it is on; if it is then try turning it off and wait about 30 seconds, then turn it back on.
- If furnace is high efficiency, it will have a white PVC pipe going out of the house that look like a 3" drainpipe, sometimes the external pipe can get blocked with ice/snow or other types of debris. Please ensure that this pipe is not clogged.
- If you look at the front of the furnace, you should see a clear plastic circle and behind that should be a light. If that light is flashing, it is a code, please count the number of flashes.
